

Using uv with Bazel

For broader Bazel workflows with uv, see the `rules_py` uv guide or the `rules_python` uv guide.

Authentication

Bazel 7 and newer supports credential helpers via the `--credential_helper` option. To use credentials stored by uv for Bazel fetches, first authenticate uv with the service that hosts the files Bazel needs to fetch:

```
$ uv auth login https://packages.example.com
```

Then, configure Bazel to invoke `uv auth helper` for matching hosts:

```
common --credential_helper=packages.example.com=%workspace%/bazel/uv-auth-helper
common --credential_helper=files.example.com=%workspace%/bazel/uv-auth-helper
```

Replace the host patterns with the hosts that serve the index and files Bazel will fetch.

Finally, add the wrapper script referenced by `.bazelrc`:

```
#!/usr/bin/env bash
exec uv --preview-features auth-helper auth helper --protocol=bazel "$@"
```

The script must be executable:

```
$ chmod +x bazel/uv-auth-helper
```
